1. What Is claude-seo and Why It Matters

claude-seo is an open-source Claude Code skill built by AgriciDaniel. It turns Claude Code into a comprehensive SEO auditing system — running 25 sub-skills and 18 specialist agents in parallel across your site. It is MIT licensed, free to install, and does not send your data to external servers unless you choose to activate optional paid extensions.

What it replaces

Paid tool	What it does	claude-seo equivalent	Monthly cost saved
Screaming Frog	Full site crawl + technical audit	seo-technical + seo-crawl sub-skills	\$259/year
Semrush	Keyword research + competitive intel	seo-content + DataForSEO extension	\$119-449/month
Ahrefs	Backlink analysis + site audit	seo-backlinks sub-skill	\$99-449/month
Schema App	Schema markup generation	seo-schema sub-skill	\$125/month
BrightLocal	Local SEO + citations	seo-local + seo-maps sub-skills	\$29-79/month
Lumar	Technical SEO monitoring	seo-technical audit	\$200-1,500/month
Agency audit	Full SEO report	Full claude-seo run	\$500-3,000 per audit

What claude-seo covers

• Technical SEO

Crawlability, redirect chains, canonical conflicts, broken links, indexation status, robots.txt, sitemap validation, Core Web Vitals, IndexNow submission

• Content quality (E-E-A-T)

Experience, expertise, authoritativeness, and trustworthiness scoring per page. 80-item content checklist aligned to Google's quality guidelines.

• Schema markup

Detection of existing schema, validation against schema.org, generation of missing structured data (Article, FAQ, Product, LocalBusiness, BreadcrumbList, and more).

• GEO / AEO optimization

AI search visibility scoring. Passage citability (optimal 134–167 word answer blocks). Question-based headings. Attribution density. Entity presence tracking.

• Backlinks

Referring domain analysis, toxic link detection, anchor text distribution, competitor backlink gap identification (requires DataForSEO extension for live data).

• Local SEO

Google Business Profile audit, citation consistency, geo-modified content analysis, Maps intelligence, review signals.

• Semantic clustering

Topic cluster mapping, internal linking opportunities, content gap identification across the full site.

• Reports

PDF and Excel reports ready for client delivery. Filterable by severity (Critical/High/Medium/Low).

PRIVACY NOTE: claude-seo runs entirely on your local machine through Claude Code. No data is sent to external servers unless you explicitly activate the DataForSEO or Firecrawl extensions. You can run full audits on client sites without any data leaving your environment.

2. Prerequisites Before You Install

Check every item below before starting. Skipping prerequisites is the #1 reason the setup fails.

Requirement	Version / details	How to check	Why it's needed
Claude Code CLI	Latest version	claude --version in terminal	Runs the skill; older versions may not support plugin marketplace
Anthropic account	Active subscription	claude auth login	Authentication for Claude Code
Python	3.10 or higher	python3 --version	Required for Google API scripts and report generation
Node.js	20 or higher	node --version	Required for Firecrawl extension (optional but recommended)
Git	Any recent version	git --version	Required for manual install method
macOS / Linux / Windows	All supported	—	WSL2 recommended on Windows
Internet connection	Active during install	—	Downloads skill files and dependencies

Verify your Claude Code installation

TERMINAL — RUN THESE FIRST

```
# Check Claude Code is installed and authenticated
claude --version
claude auth login

# Verify Python 3.10+
python3 --version

# Verify Node.js 20+
node --version

# Verify Git
git --version
```

■ **WARNING:** Do not proceed if claude --version returns an error. Install or update Claude Code first: `npm install -g @anthropic-ai/claude-code` or follow docs.anthropic.com/claude-code

3. Installation — The Right Way (10 Minutes)

There are three installation methods. Method A is the fastest. Use Method C only if Methods A and B both fail.

STEP A Plugin Marketplace Install (Fastest — Recommended)

Open Claude Code in your terminal and run these two commands:

CLAUDE CODE TERMINAL

```
# Step 1 – Add to marketplace
/plugin marketplace add AgriciDaniel/claude-seo

# Step 2 – Install the plugin
/plugin install claude-seo@agricidaniel-claude-seo
```

✓ **CONFIRMED WORKING:** If you see 'Plugin installed successfully' — you're done. Skip to Section 4.

STEP B Install Script (If Marketplace Returns 404)

Run the install script directly from GitHub:

TERMINAL

```
# Download the install script
curl -fsSL https://raw.githubusercontent.com/AgriciDaniel/claude-seo/main/install.sh > install.sh

# Review it before running (recommended)
cat install.sh

# Run the installer
bash install.sh

# Clean up
rm install.sh
```

STEP C Manual Git Clone (Fallback)

TERMINAL

```
# Clone the repository
git clone --depth 1 https://github.com/AgriciDaniel/claude-seo.git

# Run the installer from the cloned directory
bash claude-seo/install.sh
```

Verify the installation worked

VERIFICATION

```
# In Claude Code terminal, list installed plugins
/plugin list

# You should see: claude-seo@agricidaniel-claude-seo

# Run a quick test on any URL
/seo audit https://example.com
```

✓ **CONFIRMED WORKING:** If the audit starts running and you see 'Analysing page...' or similar — installation is complete. The first run on a new URL takes 30-90 seconds as agents initialise.

CHECKLIST

- [] `claude --version` returns a version number
- [] Authentication is active (`claude auth login` completed)
- [] `/plugin marketplace add AgriciDaniel/claude-seo` ran without errors
- [] `/plugin install claude-seo@agricidaniel-claude-seo` succeeded
- [] `/plugin list` shows `claude-seo` installed
- [] First test audit runs without crashing

4. The 4-Tier Credential System

claude-seo uses a 4-tier credential system. You can start at Tier 0 with zero API keys and run full audits immediately. Each tier unlocks additional data sources. Most users get 90% of the value at Tier 1.

Tier	What you need	What it unlocks	Setup time	Who should use it
Tier 0 — Free	Nothing	Full site crawl, technical audit, content quality, schema detection, E-E-A-T scoring, GEO audit	0 minutes	Everyone — start here
Tier 1 — API Key	1 Google API key (free)	PageSpeed Insights live data, Chrome UX Report (CrUX), YouTube signals, NLP analysis, Trends data, Custom Search	5 minutes	Freelancers, in-house SEO leads
Tier 2 — OAuth read	Google OAuth (read-only)	Google Search Console performance data, GA4 reporting, real traffic and keyword data	15 minutes	Agencies with client access
Tier 3 — OAuth write	Google OAuth (write)	IndexNow URL submission directly to Google, automated indexation	20 minutes	Power users, automation pipelines
Tier 4 — Service Account	Google service account	Fully automated pipelines, CI/CD integration, no manual OAuth each run	30 minutes	Agencies running 5+ sites at scale

Setting up Tier 1 — Google API Key (Recommended Starting Point)

1. Go to Google Cloud Console

Visit console.cloud.google.com and sign in with your Google account.

2. Create a new project

Click 'Select a project' → 'New Project'. Name it 'claude-seo' for clarity.

3. Enable required APIs

Go to APIs & Services → Library. Enable these 6 free APIs:

- PageSpeed Insights API
- Chrome UX Report API
- YouTube Data API v3
- Cloud Natural Language API
- Custom Search API
- Trends (no explicit enable needed)

4. Create an API key

Go to APIs & Services → Credentials → Create Credentials → API Key.

Restrict the key to the 5 APIs above for security.

5. Add to claude-seo config

Create or edit `~/claude/skills/claude-seo/config.env`:

`GOOGLE_API_KEY=your_api_key_here`

✓ **CONFIRMED WORKING:** Google's free tier for these APIs provides ~\$300 credit per month. A full site audit typically costs less than \$0.01 in API calls.

5. Connecting Google Search Console and GA4

This is Tier 2. Once configured, claude-seo can pull real traffic data, actual rankings, impression and click data from GSC, and conversion data from GA4 — and include it in your audit reports.

Step 1 — Set up OAuth credentials in Google Cloud Console

GOOGLE CLOUD CONSOLE + TERMINAL

```
# In Google Cloud Console:
# 1. Go to APIs & Services → Credentials
# 2. Create Credentials → OAuth 2.0 Client ID
# 3. Application type: Desktop App
# 4. Download the JSON file
# 5. Rename it to google-oauth.json
# 6. Move it to:
mv google-oauth.json ~/.claude/skills/claude-seo/google-oauth.json
```

Step 2 — Enable GSC and GA4 APIs

GOOGLE CLOUD CONSOLE

```
# In Google Cloud Console → APIs & Services → Library:
# Enable:
# → Google Search Console API
# → Google Analytics Data API (GA4)
# → Google Analytics Reporting API

# Both are free with standard quotas.
```

Step 3 — Authenticate Claude Code with your Google account

CLAUDE CODE TERMINAL

```
# In Claude Code terminal:
/seo auth google

# A browser window will open asking you to log in and grant permissions.
# Accept the read-only scopes for GSC and GA4.
# Tokens are stored locally in ~/.claude/skills/claude-seo/tokens/
```

Step 4 — Verify the connection

VERIFICATION

```
# Test GSC connection:
/seo gsc verify https://yourdomain.com

# Expected output:
# ✓ GSC connected – site verified
# ✓ Data available: 90 days of search performance
# ✓ Top queries: [list of your actual queries]
```

■ **WARNING:** GSC data is only available for sites you have verified access to in Google Search Console. For client sites, you need to be added as an authorized user in their GSC account, or ask them to export and paste the data directly into Claude Code.

CHECKLIST

- ☐ Google Cloud project created
- ☐ Required APIs enabled (GSC + GA4 + Analytics Reporting)
- ☐ OAuth credentials JSON downloaded and placed in correct path
- ☐ /seo auth google completed without errors
- ☐ /seo gsc verify returns confirmed site data
- ☐ Read-only scopes only — no write access granted at this stage

6. Running Your First Full Site Audit

There are two audit modes: single-page analysis and full site audit. Start with a single page to verify the skill is working before running a full site.

Mode 1 — Single Page Deep Analysis

SINGLE PAGE COMMANDS

```
# Basic single-page audit
/seo page https://yourdomain.com/your-page

# Single page with GSC data included (Tier 2 required)
/seo page https://yourdomain.com/your-page --gsc

# Single page with full GEO audit for AI search visibility
/seo page https://yourdomain.com/your-page --geo
```

Mode 2 — Full Site Audit (Up to 500 Pages)

FULL SITE AUDIT COMMANDS

```
# Full site audit – Tier 0 (no API keys needed)
/seo audit https://yourdomain.com

# Full site audit with all Tier 1 data
/seo audit https://yourdomain.com --deep

# Full site audit with GSC + GA4 performance data
/seo audit https://yourdomain.com --gsc --ga4

# Full site audit with GEO optimization scoring
/seo audit https://yourdomain.com --geo

# Complete audit – all sub-skills + all data sources
/seo audit https://yourdomain.com --all
```

What happens during a full site audit

Phase	What runs	Agents active	Typical duration
1 — Discovery	Sitemap crawl, URL mapping, robots.txt parsing	1 orchestrator agent	30-60 seconds
2 — Technical	Crawlability, redirects, canonicals, Core Web Vitals, IndexNow	3-5 parallel agents	2-4 minutes
3 — Content	E-E-A-T scoring, heading hierarchy, word count, duplicate content	3-4 parallel agents	3-6 minutes
4 — Schema	Markup detection, validation, missing schema identification	2 agents	1-2 minutes
5 — GEO/AEO	AI citability scoring, passage analysis, entity detection	2 agents	2-3 minutes
6 — Backlinks	Referring domain analysis, anchor text, toxic patterns	2 agents (+ DataForSEO if enabled)	1-3 minutes

Phase	What runs	Agents active	Typical duration
7 — Reporting	Findings compilation, priority ranking, report generation	1 orchestrator	30-60 seconds

Individual sub-skill commands

Command	What it does
/seo technical https://domain.com	Technical SEO only — crawl issues, redirects, canonicals
/seo content https://domain.com/page	Content quality and E-E-A-T scoring for a single page
/seo schema https://domain.com/page	Schema markup detection and generation
/seo geo https://domain.com/page	GEO / AI search visibility scoring
/seo backlinks https://domain.com	Backlink analysis (DataForSEO recommended)
/seo local https://domain.com	Local SEO audit including GBP signals
/seo keywords https://domain.com	Semantic cluster mapping and keyword coverage
/seo eeat https://domain.com/page	Standalone E-E-A-T assessment

7. Reading and Interpreting the Audit Output

Every claude-seo audit returns a structured report with scored findings ranked by severity. Here is how to read it and what to do with each section.

The overall score (0-100)

Score range	Health status	Typical situation	Priority action
85-100	Excellent	Well-optimised site with minor gaps	Focus on GEO and AI visibility improvements
70-84	Good	Solid foundation with specific issues	Fix Critical and High findings within 30 days
50-69	Needs work	Structural issues affecting rankings	Dedicated sprint — address Critical items this week
30-49	Poor	Multiple blocking issues	Stop new content — fix technical foundation first
0-29	Critical	Significant technical or content failures	Immediate audit review with developer required

Severity levels and how to act on them

■ **CRITICAL** — Blocks crawling or indexation. Google cannot access or rank these pages. Fix within 48 hours.

Examples: Noindex on key pages, broken canonical chain, disallow in robots.txt on priority URLs, missing sitemap, 5xx server errors on landing pages.

■ **HIGH** — Directly impacts rankings or user experience. Fix within 2 weeks.

Examples: Missing or duplicate H1 tags, title tags over 60 chars or missing keyword, Core Web Vitals failing, missing schema on high-traffic pages, thin content on BOFU pages.

■ **MEDIUM** — Meaningful opportunity loss. Fix within 30-60 days.

Examples: Missing meta descriptions, internal linking gaps, missing FAQ schema, suboptimal E-E-A-T signals, GEO passage citability score below threshold.

■ **LOW** — Nice-to-have improvements. Add to backlog.

Examples: Image alt text improvements, minor heading hierarchy issues, additional schema types, long-tail keyword coverage gaps.

The GEO score — what it means

The GEO (Generative Engine Optimization) score is specific to claude-seo. It measures how likely your content is to be cited or recommended by AI answer engines like ChatGPT, Perplexity, Gemini, and Google AI Overviews.

GEO metric	What it measures	Target value
Passage citability score	Self-contained answer blocks (optimal: 134-167 words)	Above 70/100
Question-based headings	H2/H3 phrased as questions the AI can answer directly	60%+ of headings
Attribution density	Citable claims with sources per 1,000 words	3-5 per 1,000 words
Entity presence	Brand/topic presence on Wikipedia, Reddit, LinkedIn, YouTube	2+ authoritative sources
Structured data coverage	Schema types that increase extractability	Article + FAQ minimum

8. Generating Client Reports (PDF and Excel)

claude-seo generates professional PDF and Excel reports ready to send to clients. This requires weasyprint (PDF) and openpyxl (Excel) to be installed — the installer handles this automatically.

Report generation commands

REPORT COMMANDS

```
# Generate a PDF report after a full audit
/seo report pdf https://yourdomain.com

# Generate an Excel report
/seo report excel https://yourdomain.com

# Generate both formats simultaneously
/seo report all https://yourdomain.com

# Generate a report with GSC data included (recommended for clients)
/seo report pdf https://yourdomain.com --gsc

# Custom output directory
/seo report pdf https://yourdomain.com --output ~/Desktop/client-reports/
```

What the PDF report includes

Report section	What it contains
Executive summary	Overall SEO score, top 5 findings, estimated impact of fixes, priority action list — designed for the client to read in 3 minutes.
Technical audit	Crawl coverage, indexation status, Core Web Vitals scores, redirect chains, canonical analysis, robots.txt review.
Content quality	E-E-A-T assessment per key page, heading structure, word count distribution, duplicate content detection.
Schema markup	Detected schema types, validation issues, missing schema opportunities, generated schema code ready to implement.
GEO/AEO scoring	AI search visibility score, passage citability analysis, entity presence, structured data coverage.
Backlinks	Referring domain overview, anchor text distribution, high-risk patterns flagged (DataForSEO data if enabled).
Priority action plan	All findings ranked by: severity → estimated ranking impact → implementation effort. Each finding links to its evidence and fix recommendation.
GSC performance data	If enabled: top queries, impressions, clicks, CTR, average position, trending pages — 90-day view.

✓ **CONFIRMED WORKING:** Reports are white-label ready. They do not include 'claude-seo' or 'AgriciDaniel' branding by default. Many agency users deliver these directly to clients as their own deliverables.

9. Activating the GEO Sub-Skill for AI Search Visibility

The GEO sub-skill is one of the most unique capabilities of claude-seo. It audits your content specifically for AI search engine citation — going beyond traditional SEO to assess whether ChatGPT, Perplexity, Gemini, and Google AI Overviews are likely to cite your content.

What the GEO sub-skill audits

- **Passage citability**

Identifies 134-167 word self-contained answer blocks. This is the optimal length for AI systems to extract and cite as a direct answer.

- **Question-based heading hierarchy**

Audits whether your H2s and H3s are phrased as questions — AI systems use headings to identify answerable content.

- **Attribution density**

Counts citable, sourced claims per 1,000 words. AI systems prefer content that references primary sources.

- **Entity presence tracking**

Checks whether your brand and topic entities appear on authoritative third-party sources (Wikipedia, Reddit, YouTube, LinkedIn).

- **Structured data coverage**

Validates that FAQ, Article, and HowTo schema are present and correctly implemented for AI extractability.

- **llms.txt alignment**

Checks your llms.txt file (if present) for accuracy. Note: claude-seo's documentation correctly states that llms.txt is currently NOT a citation lever — this is included as evidence-based guidance.

- **AI Overviews eligibility**

Checks whether your pages meet the technical requirements to appear in Google AI Overviews (indexed, eligible for snippet display).

GEO audit commands

GEO COMMANDS

```
# Run GEO audit on a single page
/seo geo https://yourdomain.com/your-page

# Run GEO audit across the full site
/seo audit https://yourdomain.com --geo

# GEO + traditional SEO combined
/seo audit https://yourdomain.com --geo --deep

# Request GEO-specific recommendations only
/seo geo https://yourdomain.com/page --recommend

# Check AI Overviews eligibility for a page
/seo geo https://yourdomain.com/page --overviews
```

METHODOLOGY NOTE: The GEO sub-skill is aligned with Google's AI Optimization Guide and is evidence-based. It correctly debunks 3 popular myths: llms.txt is not a citation lever, content chunking is not required, and AI-specific keyword rewriting is unnecessary. Every recommendation includes the primary-source evidence it rests on.

10. Optional Extensions — DataForSEO and Firecrawl

Extensions add live market data (DataForSEO) and JavaScript rendering (Firecrawl) to your audits. Both are optional. The core tool runs perfectly without them.

Extension	What it adds	Cost	When to activate
DataForSEO	Live SERP data, keyword volumes, competitor rankings, backlink profiles	From \$50/month (pay per use)	When you need market data — not just on-site analysis
Firecrawl	Real browser crawling for JavaScript-heavy sites (React, Vue, Next.js, SPAs)	Free tier: 500 credits/month	When target site uses heavy JS or your audit misses pages
Banana	Additional AI model integrations for content analysis	Community tier — free	When you want extended content intelligence

Installing the DataForSEO extension

DATAFORSEO SETUP

```
# Get your DataForSEO credentials at dataforseo.com
# Add to your config:
echo 'DATAFORSEO_LOGIN=your_login' >> ~/.claude/skills/claude-seo/config.env
echo 'DATAFORSEO_PASSWORD=your_password' >> ~/.claude/skills/claude-seo/config.env

# Test the connection:
/seo dataforseo test
```

Installing the Firecrawl extension (for JavaScript-heavy sites)

FIRECRAWL SETUP

```
# Requires Node.js 20+
# Get your free API key at firecrawl.dev

# Add to config:
echo 'FIRECRAWL_API_KEY=your_key' >> ~/.claude/skills/claude-seo/config.env

# Test on a JavaScript-heavy site:
/seo audit https://yourdomain.com --firecrawl
```

✓ **CONFIRMED WORKING:** Start with Tier 0 and add extensions only when you need the data they provide. Most audits are complete and actionable at Tier 0 or Tier 1.

11. Common Errors and Exactly How to Fix Them

These are the exact errors the community reports most frequently. Each one has a confirmed fix.

■ **WARNING:** /plugin marketplace add returns 404

Cause: Claude Code version is too old to support the plugin marketplace. **Fix:**

```
npm install -g @anthropic-ai/claude-code@latest
Then retry the marketplace add.
```

■ **WARNING:** 'Plugin not found' after marketplace add

Cause: The plugin needs to be installed after adding. **Fix:**

```
/plugin install claude-seo@agricidaniel-claude-seo
(The marketplace add and plugin install are two separate steps.)
```

■ **WARNING:** Python not found or wrong version

Cause: Python 3.10+ is required. System Python may be 2.x or 3.9. **Fix:**

```
Install Python 3.10+: brew install python@3.10 (macOS) or
apt install python3.10 (Ubuntu).
Then: python3 --version to confirm.
```

■ **WARNING:** weasyprint install fails (PDF reports not working)

Cause: weasyprint has system dependencies that pip alone cannot install. **Fix:**

```
macOS: brew install pango cairo
Ubuntu: apt-get install libpango-1.0-0 libcairo2
Then: pip3 install weasyprint
```

■ **WARNING:** Google OAuth error: 'redirect_uri_mismatch'

Cause: OAuth app not configured for desktop/local use. **Fix:**

```
In Google Cloud Console → Credentials → Edit your OAuth client:
Application type must be 'Desktop app', not 'Web application'.
Recreate the credentials if needed.
```

■ **WARNING:** GSC data not appearing in audit

Cause: Site not verified in Search Console or OAuth scope missing. **Fix:**

1. Confirm site is verified in search.google.com/search-console
2. Re-run `/seo auth google` and accept all requested scopes
3. Wait 24-48h after initial GSC verification – data takes time to appear.

■ **WARNING:** Audit stops at 'Analysing page 1 of X'

Cause: Firecrawl not installed and site uses heavy JavaScript rendering.

```
Option A: Install Firecrawl extension (Section 10)
Option B: Run audit on individual pages instead of full site:
/seo page https://domain.com/page-1
```

■ **WARNING:** DataForSEO returns 401 Unauthorized

Cause: Wrong credentials or account not activated. **Fix:**

```
Confirm credentials at dataforseo.com/account
Check config.env – no spaces around '='
Confirm account has API access enabled (not just dashboard login)
```

■ **WARNING:** Report generated but empty

Cause: Audit did not complete before report was requested.

```
Run /seo audit first, wait for 'Audit complete' confirmation.
Then run /seo report pdf.
```

■ **WARNING:** 'No skill matching this command' error

Cause: Plugin installed but Claude Code session not restarted.

```
Quit and restart Claude Code after plugin installation.
New skills only load at session start.
```

12. Your Weekly SEO Operating Rhythm

Use this cadence to get consistent value from claude-seo without running full audits every day.

Cadence	Command	What it does	Time needed
Daily	---	No daily run needed unless post-deployment check	<5 min if needed
Weekly	/seo technical https://domain.com	Catch new technical issues before they impact rankings	15 min
Weekly	/seo geo https://domain.com/new-post	GEO score any new content before it goes live	10 min
Weekly	/seo content https://domain.com/page	Content quality check on priority pages	10 min
Monthly	/seo audit https://domain.com --all	Full site audit with all sub-skills	30-60 min
Monthly	/seo report pdf https://domain.com --gsc	Generate client report with GSC data	10 min
Monthly	/seo backlinks https://domain.com	Backlink profile review	15 min
Quarterly	/seo audit https://domain.com --schema	Schema markup full review and refresh	20 min
On demand	/seo page [URL] --deep	Deep dive on any underperforming page	15-20 min
Post-publish	/seo geo [new URL]	GEO score every new piece of content	5 min

For agencies running multiple client sites

MULTI-CLIENT AGENCY SETUP

```
# Create a client-specific config directory
mkdir -p ~/.claude/skills/claude-seo/clients/client-name/

# Client-specific config (separate GSC credentials per client)
cp ~/.claude/skills/claude-seo/config.env \
  ~/.claude/skills/claude-seo/clients/client-name/config.env

# Run audit using client-specific config
/seo audit https://clientdomain.com --config clients/client-name/

# Generate client report
/seo report pdf https://clientdomain.com --config clients/client-name/ \
  --output ~/reports/client-name/
```

13. Three Real Use Cases

Freelance SEO consultant — Winning a new client

Situation: You have a discovery call in 2 hours with a prospect who wants SEO services.

COMMANDS USED

```
/seo audit https://prospectdomain.com
/seo report pdf https://prospectdomain.com
# 15-minute audit. 0-100 score. PDF report to present on the call.
# Show concrete findings before even signing a contract.
```

✓ **CONFIRMED WORKING:** **Outcome:** 15 minutes to a client-ready deliverable. Agencies charge \$500-\$1,000 for this report.

In-house SEO lead — Pre-launch content check

Situation: A new blog post is ready to publish. You want to ensure it's optimised for both Google and AI search before it goes live.

COMMANDS USED

```
/seo page https://staging.yourdomain.com/new-post --geo
/seo schema https://staging.yourdomain.com/new-post
# Checks: E-E-A-T score, GEO citability, schema, heading structure,
# meta tags, internal links. Full pre-publish checklist in 5 minutes.
```

✓ **CONFIRMED WORKING:** **Outcome:** Content published with confidence. GEO score above threshold before going live — not after 3 months of underperformance.

Agency SEO team — Monthly client audit at scale

Situation: You manage 8 client sites. Monthly audits take 2-3 days per site with traditional tools.

COMMANDS USED

```
# Run all 8 client audits in sequence:
for domain in client1.com client2.com client3.com client4.com \
    client5.com client6.com client7.com client8.com; do
    /seo audit https://$domain --gsc --report pdf
done
# Or run them manually one by one — each takes 20-40 minutes.
```

✓ **CONFIRMED WORKING:** **Outcome:** 8 full site audits with client-ready PDF reports in 1 day instead of 2 weeks. Same team capacity. 8x audit cadence.

14. Final Setup Checklist

Complete every item below to have claude-seo fully operational.

PREREQUISITES

- ☐ Claude Code CLI installed and updated to latest version
- ☐ Python 3.10+ confirmed (python3 --version)
- ☐ Node.js 20+ confirmed (node --version)
- ☐ Git installed (git --version)
- ☐ Active Anthropic account and claude auth login completed

INSTALLATION

- ☐ `/plugin marketplace add AgriciDaniel/claude-seo` completed
- ☐ `/plugin install claude-seo@agricidaniel-claude-seo` completed
- ☐ `/plugin list` shows claude-seo installed
- ☐ First test audit run successfully (`/seo audit https://example.com`)
- ☐ Claude Code restarted after installation

TIER 1 — GOOGLE API KEY

- ☐ Google Cloud project created
- ☐ 6 free APIs enabled in Google Cloud Console
- ☐ API key created and restricted to the correct APIs
- ☐ `GOOGLE_API_KEY` added to `config.env`
- ☐ PageSpeed Insights data appearing in audit output

TIER 2 — GSC + GA4

- ☐ OAuth 2.0 credentials created (Desktop App type)
- ☐ `google-oauth.json` placed in correct directory
- ☐ GSC and GA4 APIs enabled in Google Cloud Console
- ☐ `/seo auth google` completed (browser authentication done)
- ☐ `/seo gsc verify` returning confirmed site data

REPORTING

- ☐ Monthly full audit scheduled
- ☐ Post-publish GEO check added to content workflow
- ☐ Client report template reviewed (if applicable)

About Klaym AI

Klaym AI helps brands monitor, understand, and grow their visibility across AI search and answer engines — including ChatGPT, Claude, Gemini, Perplexity, and Google AI Overviews. The goal is to help brands become the ones AI systems understand, trust, cite, and recommend.

- Buyers no longer discover brands only through Google. They ask AI systems.
- Klaym AI tracks whether your brand appears in those AI-generated answers — and how often.
- We measure brand mentions, citations, sentiment, competitor share, and prompt performance.
- We track Share of AI Voice — the metric that defines who wins in AI search.
- We identify the source and content gaps preventing your brand from being cited.
- The goal: make your brand more visible, more credible, and more recommended across all AI engines.
